

# TransAM Framework implementation of custom face recognition engine

In TransAM Framework Cognitive, if you want to implement a third-party face recognition engine other than Microsoft's, it provides two SPI interfaces, FaceSpi and RemoteSpi, respectively. FaceSpi provides methods for local and remote face services, and on the contrary, RemoteSpi provides remote face service methods.

## Java SPI (Service Provider Interface)

SPI, or Service Provider Interface, is a service discovery mechanism built into the JDK. It allows you to dynamically find service implementations for an interface, somewhat similar to the idea of IOC (Inversion of Control), which moves the control of the assembly out of the process, and is especially important in modular designs. To use the SPI mechanism, you need to create a document named Service Interface in the META-INF/services/ directory under the classpath, and the content of this document is the concrete implementation class of this interface.

## Using Face Recognition on Pepper

The Pepper robot supports face recognition in NAOqi version 2.9.3 and above, which provides developers with a solution to implement face recognition on Pepper, and allows developers to integrate third-party face recognition engines other than Microsoft's without modifying the logic code.

## Approximate steps to implement the Pepper Face Recognition SPI functionality

- Create an Android Application project.
- Import TransAM Framework Cognitive into the project.
- Implement FaceSpi and RemoteFaceSpi interfaces.

## Introducing Dependency Packages

In the Android project, add the maven repository:

```
maven {  
    url 'http://maven.softbankrobotics.com.cn/releases'  
}
```

Add the following dependency to the `build.gradle` file of your Android project:

```
implementation 'cn.softbankrobotics.transam:transam-cognitive:1.0.6'
```

Create the resources/META-INF/services folder in the Android project and create two files with the following contents:

```
* File name: com.softbankrobotics.transam.congnitive.face.spi.FaceSpi  
The content is: the full path name of the class that implements FaceSpi in the project, e.g.: com.p  
* File name: com.softbankrobotics.transam.congnitive.face.spi.RemoteFaceSpi  
The content is: the full pathname of the class that implements FaceSpi in the project, e.g.: com.p
```

## TransAM Framework Cognitive SPI Usage Example

In TransAM Framework Cognitive SPI, there are two interfaces FaceSpi and RemoteSpi.

| Interface Name | Properties | Description | ----- | ----- | ----- | | FaceSpi interface | FaceSpi implements the face detection and face matching interface and distinguishes whether it is implemented locally or remotely by the isRemote property.  
| RemoteSpi | RemoteSpi interface | RemoteSpi contains parts of the interface that require a remote service to implement.  
| RemoteSpi

### FaceSpi interface description

#### IsRemote

Get whether the current face service interface is provided locally or accessed remotely. FaceSpi provides two interfaces, face detection and face matching, which can be implemented locally or remotely respectively.

#### Interface Description

Inherit FaceSpi interface, override isRemote() function.

```
@Override  
public boolean isRemote() {}
```

#### Return Parameters

| return type | description  |
|-------------|--|
| boolean     | Determines if the current implementation is local or remote. |

#### Init

Initialise the FaceService service, mainly loading the face service engine.

#### Interface

The init() function with parameters is used to configure the configuration of the third party face recognition service engine.

```
@Override  
public void init(Object configuration) {}
```

#### Parameter Description

| Parameter Name | Attribute | Description | ----- | ----- | ----- | | configuration | Object | Parameter information used to configure the third-party face recognition service engine |

#### detect

Face detection and attribute information return.

#### Interface Description

Detect face information from image data.

```
@Override  
public FaceDetectResult detect(InputStream faceImage) throws FaceException {}
```

#### Parameter Description

| Parameter Name | Attribute | Description | ----- | ----- | ----- | | firstFace | InputStream | The face image being matched | secondFace | InputStream | The current detected face image | | secondFace | InputStream | The currently detected face image |

#### Return Parameters

| Return Type      | Description                        |
|------------------|------------------------------------|
| FaceDetectResult | Returns face detection information |

#### getEngineName

Returns the name of the currently used face recognition service engine, SPI loads the current engine through this function.

#### Interface Description

Used by SPI to return the engine name.

```
@Override  
public String getEngineName() {}
```

#### Return Parameters

| Return Type | Description |
|-------------|-------------|
| String      | EngineName  |

### RemoteFaceSpi interface description

#### Init

Initialise the FaceService service, mainly load the face service engine.

#### Interface Description

The init() function with parameters is used to configure the configuration of the third party face recognition service engine.

```
@Override  
public void init(Object configuration) {}
```

#### Parameter Description

| Parameter Name | Attribute | Description | ----- | ----- | ----- | | configuration | Object | Parameter information for configuring the third-party face recognition service engine |

#### createPerson

Creates the personal information that will be saved to the Face Recognition Service Engine.

#### Interface Description

Registers the face information to the Face Recognition Service Engine and binds the unique identifier of the personId.

```
@Override  
public String createPerson(String groupName, Person person) throws FaceException {}
```

#### Parameter Description

| ParameterName | Attribute | Description | ----- | ----- | ----- | | groupName | String | The name of the group created in the face recognition service engine | | personId | String | The user's personal ID, a unique identifier generated by the Face Recognition Service engine | | targetFace | Rectangle | Position of the target face in the rectangle frame of the image | | faceImage | InputStream | The image information of the face |

#### Return Parameters

| Return Type | Description      |
|-------------|------------------|
| String      | confidence value |

#### getPerson

Get the personal information registered in the Face Recognition Service Engine.

#### Interface Description

Used by SPI to return the engine name.

```
@Override  
public Person getPerson(String groupName, String personId) throws FaceException {}
```

#### Parameter Description

| ParameterName | Property | Description | ----- | ----- | ----- | | groupName | String | The name of the group created in the face recognition service engine | | personId | String | The user's personal ID, a unique identifier generated by the Face Recognition Service engine |

#### deletePerson

Deletes a Person from the Face Recognition Service Engine.

#### Interface Description

Compares the confidence level of two face images.

```
@Override  
public double verify(InputStream firstFace, InputStream secondFace) throws FaceException {}
```

#### Parameter Description

| Parameter Name | Attribute | Description | ----- | ----- | ----- | | firstFace | InputStream | The face image being matched | secondFace | InputStream | The current detected face image | | secondFace | InputStream | The currently detected face image |

#### Return Parameters

| Return Type | Description      |
|-------------|------------------|
| double      | confidence value |

#### search

Get user information by searching the face recognition service engine with the group name and current face image information.

#### Interface Description

Registers the face information to the Face Recognition Service Engine and binds the unique identifier of the personId.

```
@Override  
public Person search(String groupName, InputStream faceImage) throws FaceException {}
```

#### Parameter Description

| ParameterName | Property | Description | ----- | ----- | ----- | | groupName | String | The name of the group created in the face recognition service engine | | faceImage | InputStream | The image information of the face |

#### addFace

Registers the face information to the Face Recognition Service Engine and binds the unique identifier of the personId.

#### Interface Description

Registers the face information to the Face Recognition Service Engine and binds the unique identifier of the personId.

```
@Override  
public String addFace(String groupName, String personId, Rectangle targetFace, InputStream faceImage) throws FaceException {}
```

#### Parameter Description

| ParameterName | Attribute | Description | ----- | ----- | ----- | | groupName | String | The name of the group created in the Face Recognition Service engine | | personId | String | The user's personal ID, a unique identifier generated by the Face Recognition Service engine | | targetFace | Rectangle | Position of the target face in the rectangle frame of the image | | faceImage | InputStream | The image information of the face |

#### Return Parameters

| Return Type | Description  |
|-------------|--|
| String      | Unique identifier of person's personId returned from the Face Recognition Service Engine |

#### getEngineName

Returns the name of the currently used face recognition service engine, SPI loads the current engine through this function.

#### Interface Description

Used by SPI to return the engine name.

```
@Override  
public String getEngineName() {}
```

#### Return Parameters

| Return Type | Description |
|-------------|-------------|
| String      | EngineName  |

### RemoteFaceSpi interface description

#### Init

Initialise the FaceService service, mainly load the face service engine.

#### Interface Description

Registers the face information to the Face Recognition Service Engine and binds the unique identifier of the personId.

```
@Override  
public void init(Object configuration) {}
```

#### Parameter Description

| ParameterName | Property | Description | ----- | ----- | ----- | | configuration | Object | Parameter information used to configure the third-party face recognition service engine |

#### getPerson

Get the personal information registered in the Face Recognition Service Engine.

#### Interface Description

Used by SPI to return the engine name.

```
@Override  
public Person getPerson(String groupName, String personId) throws FaceException {}
```

#### Parameter Description

| ParameterName | Attribute | Description | ----- | ----- | ----- | | groupName | String | The name of the group created in the Face Recognition Service engine | | personId | String | The user's personal ID, a unique identifier generated by the Face Recognition Service engine |

#### deletePerson

Deletes a Person from the Face Recognition Service Engine.

#### Interface Description

Compares the confidence level of two face images.

```
@Override  
public double verify(InputStream firstFace, InputStream secondFace) throws FaceException {}
```

#### Parameter Description

| ParameterName | Property | Description | ----- | ----- | ----- | | firstFace | InputStream | The face image being matched | secondFace | InputStream | The current detected face image | | secondFace | InputStream | The currently detected face image |

#### search

Get user information by searching the face recognition service engine with the group name and current face image information.

#### Interface Description

Registers the face information to the Face Recognition Service Engine and binds the unique identifier of the personId.

```
@Override  
public Person search(String groupName, InputStream faceImage) throws FaceException {}
```

#### Parameter Description

| ParameterName | Property | Description | ----- | ----- | ----- | | groupName | String | The name
